Hi,

I have just installed SBS 2003 and all the patches. Everything was working fine.

I have installed the SUS on the server and had started to download the patches. The DSL went down stopping the download. I was going to move the server anyway so I closed down and moved it.

Now the default companyweb page comes up fine but the links for Information and Answers, Remote E-mail Accessm and Remote Server Management come up with a HTTP 404 error – Page can not be found. All the other hyperlinks on the page work fine.

I have looked in IIS and all the web sites seem to be running. I have re run the internet connection wizard.

Any Ideas?
