Hello,

I have a bit of a strange problem with a Terminal Server I look after.  
The set up is ...

1 x Windows 2000 SBS Server with Terminal Server License Manager installed and activated.

1 x Windows 2000 Server acting as the Terminal Server in application mode

My customer rebooted both servers on Friday and since then, they cant logon to the terminal server. The event log says, cannot issue client license and the client sees a message saying the terminal server ended the connection. This is using XP Clients & new Windows 98 clients that should have a grace logon period before we needs to get some more calcs.

Strangly though, I can VPN in from the office and login to the TS as any of the users using XP with no problems whatsoever.

Any ideas?

Rgrds,

Jon

Apologies if this has been discussed recently, my ISP has a very short retention time.
