Hi All:

This morning our internet connections from our SBS server went south. I have checked the ISP connection and the DSL modem by using a laptop to connect to the internet through the DSL modem, service works fine. Our setup is as follows: SBS with 2 NIC's, router (Netgear), DSL modem (Actiontec). I have checked the IP addresses and nothing appears changed from last Friday when everything was running fine. I have even rerun the ICW hoping that would solve the problem but still cannot connect to the internet. I hope that someone can give me some direction to solve my problem.

A second issue is that in our event log I am receiving Event ID errors 1126, and warning id 1655. I have read KD318170 and it refers to installing the latest service pack. I have installed SBS SP1a which should include the latest. Would a reinstall of SP1a solve the problem?

Any help would be appreciated. I am sure that I have not been specific enough so will provide any additional information that may be needed.

Thanks in advance

Gerald P
