I am setting up a Windows 2003 web server on an SBS2000 network (dual NIC setup). Originally the web server was in the DMZ but we were having connectivity issues with the folks inside the network accessing a database located on that server. I have decided to move the server back inside the network and wanted to know if I can keep the dual NIC setup on the SBS2000 server and have all the external web requests still directed to the 2003 web server. What do I need to do to ISA to make this happen? What security implications am I going to face now?

TIA
