I use Macromedia Contribute 2 (in combination with Macromedia Dreamweaver MX) to manage the content of a number of my clients websites held on external web servers.

All worked fine before I installed a SBS 2003 network. Now when I try to use it the connection process fails.

MM Contribute uses a connection wizard to configure a connection to an external hosted website. First you browse for the URL of the site to be managed. This part works fine. Then you enter your connection information. In my case the connections are via FTP with a simple username and password. The web servers are supplied by a hosting company and I believe they are Linux boxes. The FTP account information also seems to work. Next you select "choose" the directory on the remote server that is the root directory of the website. This also seems to work as I can navigate the remote FTP account directory tree to select the appropriate directory ("public_html"). The final stage Contribute then validates these connection details. It is this stage that fails with an error message to the effect that it can't connect to the website.

I've tried adding a Protocol Rule that "allows all/all/all" as describe in the Microsoft Knowledge Base Article - 295667. This had no effect on the problem.

Any help gratefully received.

Mark W.
