

Can't delegate/share to a group

I am running Exchange 2000 SP3 on SBS 2000 on a network with one server box. When I try to add a distribution group delegate to a mailbox through Outlook 2002 on a Windows XP SP1 machine, it fails with no message. I can add the group, but it always set the permissions to none.

When I try to share a folder to a group I get the error "The modified permissions could not be saved. The client operation failed".

I can delegate and share to users.

I am guessing its either some permissions problem or an Exchange corruption, but I am not making any headway. I have not been able to find anything very helpful in the NGs or via Goggle searches. Help!

When I first encountered the problem, E2k was running in mixed mode (default, not brains). I found that this should only work in native mode. I switched Exchange to native mode via the properties page. I saw no complaint on screen or in logs when I switched. I restarted the whole server for good measure. Exchange's General Properties now shows Native mode, but the two administrative views options can be checked. I thought the "Display administrative groups" option was supposed to be grayed out. The distribution groups existed prior to the mode switch.

Dithered Security Log entries follow. This attempt was from a workstation outside the domain logged in to the SpamBox mailbox over a VPN. The behavior is similar when the delegation is attempted from a workstation in the domain.

Thanks,

Joe M
