Yes

I have two IBM/Intel Server NICs (10/100/1000), and one of them is disabled, the other is enabled with a static IP (192.168.20.99) and currently plugged into a switch (nothing else is plugged into the switch). There is also an on-board NIC that is also disabled. When things are running properly, the IBM NICs will be set up as one virtual NIC with load balancing and fail-over support and will be connected to a switch. The onboard NIC will be set up as the second NIC connecting the server to a 3Com firewall/router/VPN.

In a previous installation, without installing all the Service Packs, I did get the server set up to access the internet through the second NIC through the firewall and I can get another computer connected to the switch to access the internet through the server.

To get the server NIC load-balancing support requires an update the the Intel chipset and the drivers for the NICs.

Those updates require Windows 2000 SP4. I have not yet tried installing SP4 in this iteration, I was going to leave that as the last SP to install.

Paul W.
