New client has head Office with 2000 SBS.

Has a remote office with 8 pcs. ADSL was with internet connection sharing off one pc into hub.

No real issues but I recommended not best setup especially security so put in an ADSL Router.

Ever since put router in Outlook has been a pain (they connect vpn on each of the 8 pcs) then start outlook. Either outlook wont start...can't find exchange server or emails take an age to open.

Also finding network connections are dropping off. Thought it was the router so got another and the same thing.

These routers are wireless too as there was an Access Point for two wireless laptops. Thses are having the same issues as the cabled pcs.

Any suggestions would be appreciated
