Open manage and array manager are the two pieces of software usually is to be installed...

How old is the server / warranty left ?

Use Dell online support option... its quite good.

I don't think it has any diag.oftware. At least I don't see any on the server. It is a Dell PowerEdge. The other PowerEdge we have has diag. software, but this one doesn't have it loaded. I think I'll load it on this server.

Hi Chad

I would generally be feeling the same as Steve.

Does your RAID card have any diagnostic software, this will definately give you required info.

If drive was failing the software would say failing, also are there any configs to alert you i.e my raids have a facility to scream at me if there was an issue so you are aware prior to disaster.

That's what I was afraid of. I diverted my backups to a USB external until I can replace it.

May be an indication that a drive is failing?
If so you'd better
replace
ASAP.

I had to reboot my server
since it was completely
unresponsive. I
went
through the event logs and
found the following:

1:17:29 AM device
\Device\Scsi\mraid2k1 Did
not respond within the
specified time out period
1:17:39 AM system
shutdown was unexpected
7:34:11 AM driver detected
a controller error on
\Device\Harddisk1\DR4

Any help??
