In article <eXECoQ\$nJHA.5420@xxxxxxxxxxxxxxxxxxxxxxxx>, [chris@upton-sims.freemove.co.uk](mailto:chris@upton-sims.freemove.co.uk) says...

I am trying to setup some exam testing software on a workstation which require the local machine to open a localhost address (Catlglobal software). The ISA server is displaying a 403.4 error saying I must use an https address. I think this is because, when I set up OWA, I inadvertently made all pages secure.

I don't know how to reverse this for the local pages and I don't want to mess up the OWA settings.

Could anyone direct me as to which subfolders I should remove the "require 128 bit" security so that I can access the localhost? Can I remove this from the root of the ISA server or would this replicate throughout all the folders?

Any advice gratefully received

Create a new rule for just this site.

You should be able to get the guff you want from Thomas Shinder's pages...
