Arun,

take a look at this piece please:

```
Public Sub CreateMyMessage(ByVal mydestmsg As XLANGMessage)
    mydestmsg(0).LoadFrom(New MyStreamFactory("this
is my binary test data to construct message from"))
```

The XLANGMessage "mydestmsg" variable here is just an orchestration message. Just call this method in an construct message shape and pass an orchestration message as the parameter. XLANGMessage has a method "LoadFrom", which allows it to be constructed programmatically.

Don't know whether this scenario will allow you to do unit testing, since I believe you need the orchestration runtime. Let me know if things still aren't clear please.

Best regards!

Christof
