Hi,

Im having huge problems consuming an Axis web service from Biztalk 2004. The request goes well and Axis sends the response, however biztalk complains about the response. Reson: Body part is null or something like that. The errors are a bit different depending on wich pipeline i use. I have tried XmlReceive and Passthru aswell as my own Multipart Mime Receive pipeline.

I use the Literal/Document encoding type on the Axis side. The wsdl is hand made due to the way the web service is implemented. This web service accepts anything that comes in and if there is a match for the method requested it calls that method. So when a wsdl document is created for the WS we don't get any schema information about the input and output xml. We had to add that so that BizTalk could use this schema for the response. The answer follows HTTP 1.1 standard and is using "chunks".

Can someone help me with my problems. I'll be happy to post the wsdl if someone want's to look at it.

Thanks for any help.

Regards

Magnus
