Aha! Found the solution. I had turned on DTC, but I had forgotten to turn off RPC security. It seems to be working now.

I am trying to administer BizTalk installed on a remote machine from my local workstation, but I am getting some strange errors.

I have BizTalk 2004 installed on one server, the databases set up on another server, and then my local developer workstation. I would like to use BizTalk explorer to create some ports on the server, but I don't want to install Visual Studio on the server. So, I'm trying to use my workstation to connect to the remote server.

I can connect fine and browse the installed orchestrations, etc. but when I try to change anything (update a binding, add or delete a port) I get this error:

The transaction has already been implicitly or explicitly committed or aborted

Then, after I get that error once, I get this error until I restart Visual Studio:

Not allowed to change the 'ConnectionString' property while the connection (state=Open).

Any ideas? Is it possible to use BizTalk Explorer to administer remote servers?

Thanks,
Don

ps. By remote I mean not the computer I'm sitting at. The servers are on the local network.
