I'm receiving a messaging error. I have a send port bound to a receive port. The send port has an outbound map specified which outputs some "Custom Header" attributes including Doctype System, include XML Declaration, UTF-8 encoding. This works fine in the development environment but I'm getting the following, even with the Pass Through pipe?

The Messaging Engine failed while executing the outbound map for the message going to the destination

....

Details:"Unexpected end of document. This is not a new document. The disassembly is incomplete. "
