Hi

I've created a map and it's using an external assembly in a script. It works OK, but I've found that if I make a change to the external assembly when I use the TEST MAP function it doesn't get the new version of my assembly, until I restart Studio.

After building my external assmebly I'm uninstalling and reinstalling it from the GAC, I'm not changing the version number of the assmebly.

I've also tried dropping and re-adding the reference in my Biztalk project, but it still gets my old code until I restart Studio.

(Very annoying – please help!)

Thanks

Paul
