Hello Gurvinder,

In your case you can't use the out of the box FTP adapter, according to your business logic, you need to call the FTP site based on some outcome (from your spoc) from your external systems.

You need to make use of some .NET FTP components like nSoftware

<http://www.nsoftware.com/products/component/ftp.aspx?gclid=CM6msqSms40CFRWOEgodbDcy1A>

write your custom code to call the FTP site.

I guess even the FTP adapter internally uses FTP library from XCEED.

Use the custom .NET classes in the EXpression shape. Include all FTP client logic in these classes.

that mean i have to create receive logical port in my orchestration and that

RE: Download file from ftp site

i dont want because once i execute the stored procedure i wait for response and once i have it i just want to download file and if i use receive port then receive port will poll it self (independent of orch) in that case if orchestration is at some other location(shape) and in mean time RecLoc will poll in then i will have routing failure

Thanks,  
Guvinder

Use FTP adapter to receive file from FTP location ,  
configure a Send port  
with FILE adapter, and set filter condition  
BTS.ReceivePortName = "<<your ftp  
receive port name>>"

Hi Guys,

I want to know how can download file from  
ftp site to my local directory  
without having receive locations in my  
orchestration

Thanks,  
Gurvinder
