Is the source code for BTSTask available so I can add all the missing functionality ( or am I going to have to use Reflector ) ...

like Adding an application reference on creation, Start application.

I'm sure I'll find tons more stuff missing

Hi,

I am writing a js script (using WSH) to install and configure our Biztalk system. So far I have been able to create our applications, install the assemblies and import bindings ( all via BTSTask ).

However, I cannot seem to find a way to start the applications. There is no equivalent WMI class for an application, nor is there a command line interface for this. I tried using the ExplorerOM object model but I cannot enumerate the Applications collection, or execute the Item method from jscript ( not jscript.NET)

Short of writing a .NET exe, have I missed anything ?

Cheers..
