Hallo,

we have installed a biztalk 2006 server to transfer XML files generated on our HOST system.

the ftp receive location is configured correctly to the FTP-Server provided by the BULL GCOS8 Host-System. But when the ftp-connector tries to receive any file from the location on the host it fails.

the logfile shows the open/autheticition phase is OK.

the FTP-connector then initiates an LIST command on the FTP-Server to find files matching the file-mask.

output seems to be ok, but the file is never transferd.

with using the windows xp ftp-command line tool everything works fine, open, authentication, LS or LIST command and as well any kind of GET and DELETE ....

questions:

- 1.) anyone knows how to configure FTP connector to understand "old legacy" FTP implematations (like BULL GCOS8 FTP Server)
- 2.) how to send an command to the FTP-server to change the output from the LIST command to make it readable to the Biztalk FTP-connector.

yours  
Sebastian
