Spanner,

When you run configuration the account under which configuration.exe is run needs to be DBA on the SQL box. It has to be a domain account, and you have to have DTC configured on both machines. You can always pre-create the databases and point configuration to them, but then you will need to be DBO for those databases.

Take a look at this article:

<http://msdn.microsoft.com/library/default.asp?url=/library/en-us/BTS06coredocs/html/e4d0e707-6b9e-49e1-9f17-19b3bac1229e.asp>. Among other things it point to the list of domain groups that you will have to create.

— Michael

Hello

We are trying to install BizTalk 2006 Server into a clustered environment.

We have SQL Server 2005 clustered and already installed within a data tier.

We are now trying to install BizTalk into a middle tier and point it at our

database server. However the installation keeps failing when BizTalk attempts

to create its databases on our clustered database server. This appears to be

RE: BizTalk 2006 Installation Problem

a permissions issue. However, we have given sysadmin rights to the user account which the BizTalk server services run under. This does not appear

to

address the issue. We have now had four attempts to install BizTalk and

each

one failed â?? HELP!!!!

Does anyone have experience of installing BizTalk 2006 on a split environment i.e. database held on a separate box to BizTalk application.

If

so how did you manage it?

--

Many Thanks

Spanner
