I want to send an HTML formatted email through BizTalk. I am trying to send an order confirmation with multiple lines of parts that I would like to put in a table which means I need to send the email as HTML and add table tags. I set up an SMIME pipeline to send the email as HTML and I have the orchestration pulling the fields from a Config file. My email is being sent out as HTML but it is coming to me in one giant paragraph with no formatting. I tried adding HTML tags to my config file but it doesn't do anything with them.

Does anyone know what I need to do to have the html tags in my config file recognized or if there is another way to do this?

.
