Correction of last post (Spellings). Sorry

So it is a job requirements that control the proficiency and power of any one.

But when it comes to a state that there is no career advance and no evolution with your environments, a one should look for all possibility to get a chance and to have an opportunity to follow the every day technology.

For sure the certification is not mapped to proficiency but it is a prove that you are on the correct road- even for those who have certif... by any means,.. their performance will determine if they deserve the cert. or not.

The every day new technology by MS when compared with clients Large scale projects in the market (that may span over 2-3 years of analysis and developments) who want to adapt MS platform. It becomes hard decision for any of them to adapt MS due to every day evolution. So the companies employees will spend most their time in developing and satisfying the project goals that were designed before several months or years. while they don't have a time to follow every day technology. So a need those is raised to be not lagged off, and here a certification is a proof that I'm up-to-date.

My old posts for ref:
