Echoed forth from the dank caverns of microsoft.public.cert.exam.mcsa, the plaintive wail of mdbl:

BTW are you sure you can't share folders thryough the network when logged in a workgroup???

Try it and see.

Well I get the challenge ;),

My experience says that I can simulate the creation of a network shared folder using explorer or computer management console simulate that environment with a virtual network adapter configured as loopback. (I have only 1 PC to make these kind of tests, so I had to use the loopback solution).

As a proof I can access the folder by typing the \\computername\share_name\
I could not

BTW any other comments on the question??

(Anyway the site should be reliable as It is one of those advised by MS itself!)

Thanks
MD
