Dear all,

I need to develop an analysis application with .NET
Based on that I am not really sure about the proper solution to implement that tool and I would like to get your experience opinion.

First of all I have collected data on a centralized SQL server database. What I need to do is provide an application interface suitable to run default or customized query to extract different type of data. From that query results user would be able to print it or export the result anywhere.

The main objective is that the application should be really open in case customer want to customize it. For reporting I was planning to use Crystal report.

What is your idea on performing that analysis task and in which manner (Web form or App form) ?

I have heard about report services, what is this about ?

Thanks for your help on guiding me in suitable solution specification

regards
serge
