Hi,

I am confused on the issue of Domains and security boundries. Can I have different password policies in the same domain? Couldn't I have one policy that has a 6 character password requirement and link it to a GPO for the general user, and then have a 12 character password requirement for admin group linked through a GPO? Also what happens when you have a GPO like this with password requirements linked to a site that crosses domains? Does it just not process or execute properly?

Thanks – Wayner

.
