HI harvey the script just wont run unless u login
u r machine doesnt have any scripts so that is mere ly not possible

I came across a question on an exam preparation test. The answered indicated that a user could "log on" to the domain and have user based GPOs, in which their user account has allow-read and allow-apply rights, applied to their account even though there PC wasn't a member of the domain (stand-a-loan).

My laptop isn't a member of any domain, but I often connect to domain resources at my customer's sties without any problem. Windows pops up a dialog for entering credentials. I simply have to enter a domain\userid and password. But of course, I'm simply authenticating against AD, I'm not logging into AD, and therefore, no login script is ever ran and no GPOs are ever applied.

Does anyone know what this exam prep question was trying to say? Or are they just bowing wind?

TIA
