<LOL>

If you use braindumps, your machine will be infected by criminals.
You get what you give.

Story

These groups are so much about brain dumps and exam cheats, so I wanted to see what the fuzz was all about. I set up an isolated environment and a file-sharing client, downloaded cheat software, backed up and secured the environment, and ran setup. To my amusement I got infected with a trojan. If you try to cheat on the exams, you deserve what's coming to you.

So let this be a warning to you cheaters.

Procedure

- 1) Install Virtual PC (or Virtual Server)
- 2) Install Windows Server (or whatever) in a virtual image
- 3) Install Windows Defender (or other malware detection tool)
- 4) Back up the image
- 5) Install LimeWire (or other per to per stuff)
- 6) Search for "certs", "brain dump", etc.
- 7) Download some of the "products" (If you, as I did, download brain dumps on issues that aren't interesting to you, you can test it without committing moral suicide, I downloaded some CISCO dump)
- 8) Disconnect the network adapter from your configuration and remove any shared folders

Re: Brain dumps

- 9) Log in as administrator on the image (to open up as much as possible)
- 10) Optionally: set up loopback adapter (in case the rootkits, viruses, etc. just shows up if it finds there is a network there)
- 11) Close all programs and have a look in Task Manager
- 12) Run brain dump "software"
- 13) Close all programs and have a look in Task Manager (there are, of course ways of hiding yourself from the list, but I didn't suspect these criminals to be very advanced)

Hopefully you will burn when you get to interviews too, of course.

</LOL>
