I am an MS expert so this might not apply to Oracle, but it would not hurt anyone anyway.

If I were you I would try to do something like:

Set the ADO connection setting to true.

Get a tool that will show you what is going on Oracle if such a tool exists at all (in MS-SQL world there is a tool called SQL Profiler that tracks whatever T-SQL goes on the server).

See if you can find any clues there.

Also you can check the logs of the Oracle server if you have not checked them already.
