Hi Dave,

if it is just for the duration of the program execution I have found the following works for dbf files...

```
Dim f_rsIdx As ADODB.Field
```

```
rs.CursorLocation = adUseClient ' without double checking I think this is vital
```

```
,
```

```
' Open database here
```

```
,
```

```
'Create the recordset
```

```
rs.Open .....
```

```
'Index on field called Author
```

```
Set f_rsIdx = rs.Fields("Author")
```

```
f_rsIdx.Properties("Optimize") = True
```

Hope this does the trick for you.

Colin
