I have very critical problem . I use ADO 2.7 ActiveX Component to connect SQL Server 2000 . Some place on my applications use ADO to start Transaction on client-side following sample Code ;

```
"  
Dim Cnn as ADODB.Connection  
Set Cnn = New ADODB.Connection  
Cnn.CursorLocation = adUseServer  
Cnn.Open "Provider=sqloledb; Data Source=" & Server & ";Initial Catalog=" & DB & ";User Id=" & User  
& ";Password=" & Password & ;"  
  
cnn.BeginTrans  
.....  
.....  
.....  
cnn.CommitTran  
  
"
```

SQL Server 2000 user option which is " XACT_ABORT " set ON.

I can not manage transaction integrity. In My SQL Statement there are alot of insert to different table but after end of the transaction there is onyl one record on one table . Where is the others ?
