i need to connect to sql server with a db connection string specified at runtime in my console app. i'm only able to connect when i hard code the string or assign the hard coded string to a variable and use it in the app. I'm not able to connect with strings read in from the command line. I've been playing around with string conversion and stuff for about 2 days and now i'm looking for an example of this that works because i'm done playing around. i'm about ready to go to .net if i can't find an example of how to do this with unmanaged code.
