Hi,

I am from SQL server background
this question is regarding oracle

I have a oracle procedure which executes a query to access external
databases
the procedure is owned by a user called owner

i am trying to run a vb application under credentials user1 (who does not
have permissions to run the external query in the stored procedure) i am
getting access denied error
user1 has permissions to run the stored procedure

when run from sqlplus both user1 and owner can execute the stored procedure

my friend says that when executing stored procedure owned by owner
it should run under credentials of owner and not under user1

Help me please ...!

Arun
