Hello Friends,

I am trying to find out how to Call Oracle Stored Proc from VB6.0 + ado that takes in three strings as IN parameters and outputs an array of records or result set having file names and file paths. Any examples would be appreciated.

```
mypackage.GET_Files(acctno, field2, field3, rec_array)
where IN parameters are all of type Varchar2(10),
and Out Parameter rec_array IS RECORD(file_path VARCHAR2(10), file_name
VARCHAR2(10));
```

Thanks in advance.  
Jack Anderson
