-

I am using MyODBC Driver 3.51 and ADO connection to connect to a MySQL 4.1 server using BCC6.

The MySQL Server runs on a WinXP platform.

When I connect through the LAN everything runs ok.

When I am using remote connection through the wLAN (ISDN connection to the server) I may receive as a respond to a SELECT query that transfers to a local ADO DataSet data from the server (randomly from 1min to 10 min)

"Server gone" message and I have to reconnect to execute the query. I execute queries every 1min.

The MySQL wait_timeout is 8 hours.

The queries are small. Most of the times no records are returned.

Any suggestion?
