Hi,

Thanks so much for your help.

I'm not using the admin account.

I've limited the admin user and admins group.

Created a new database from the logged in super user.

Then as the super user / database owner from the new database removed most permissions.

This was based on the instructions from SecFaq.

This works fine if I'm access the database from a VB program, where I just have tables etc.

But I'm trying to provide some user security for access developers.

(I guess I'll also need to add a normal user without privileges too.)

So I'm adding as few permissions as possible.

I looked and I already can see system objects.

When I open any of the system tables I can see the records, values but I can alter any of the data.

I'm guess this must be the problem?

What permission do I need for that?

Best regards,

Jules.
