We are developing a Windows Form application that try to retrieve the Database Schema from MS SQL Server and Oracle. The application is

developing

under Visual Studio .NET 2005 with the use of Schema API from ADO.NET 2.0.

Yet this newgroup covers ADO, pre .NET.
ADO.NET is off-topic.

Read this and pick one:

Newsgroups that have "dotnet" somewhere in the name, are for .NET support
Newsgroups that DO NOT have "dotnet" somewhere in the name, are for _NOT_
for .NET support.

Try one of:

Newsgroup support on .NET:
microsoft.public.dotnet.* hieracrchy

Newsgroup support on ADO.NET:
microsoft.public.dotnet.framework.adonet

Newsgroup support on VB.NET:
microsoft.public.dotnet.framework.languages.vb
microsoft.public.dotnet.framework.languages.vb.controls
microsoft.public.dotnet.framework.languages.vb.data
microsoft.public.dotnet.framework.languages.vb.upgrade

Newsgroup support on C#:
microsoft.public.dotnet.framework.languages.csharp

Newsgroup support on Datagrid:
microsoft.public.dotnet.framework.aspnet.datagridcontrol

Newsgroup support on Windows Forms
microsoft.public.dotnet.framework.windowsforms

Re: How to get meta data info in ADO.NET 2.0

microsoft.public.dotnet.framework.windowsforms.control

microsoft.public.dotnet.framework.windowsforms.databinding
