Hi,

I have troubles with a threaded application on W2003 server. It seems to leave open connections behind time to time, it sums to hundreds over a day (the application make thousands). It is using the SQLOLEDB provider, MDAC 2.82.1830.0, SQL Server 8.00.2039 (SP4), Windows 5.2 (3790).

I put two Trace (print) statements for testing: (1) Connection is opened. 2) Connection is Closed.) I can see the two statements without any Exception. But the problem is when I see on the Performance viewer (perfmon.exe/ perfmon.msc->SqlServer:General Statistics, User Connections) it shows Number of users connected to the system is like thousands and more day by day ,Means the number of open connections are in Hundreds...thousands and more . I am also loosing the connections immediatly with out any exception.But still I am seeing open connection.

Please can anybody sort out my problem,

Is there a known bug like this? Is there a way to trace the SQLOLEDB provider?

Regards,
Rasheeds

.
