The trouble is that all these additional files will then have to go into my installer and not sure now that will be worth it.

Did you find any improved performance (mainly SELECTS) with OLE DB drivers as compared to ODBC?

I am currently connecting with the ODBC driver from Intersolve and that seems quite good, but can't compare to anything.

Had a little explore into accessing the Interbase API directly from VB, but that is probably (most likely) unrealistic.

RBS

Have installed the FB ODBC driver without any problem and did a regsvr32 on that...

Did it install FBClient.DLL ? Where did it put it?

but still I can't do a regsvr32 with the file IbOleDb.dll

It may be that FBClient.DLL is crucial to register it
