I have a question and I'm not quite sure if this can be done or not. Does any have any idea(s) on how to create a SQL stored procedure from a text file using C#.

There was no way for you to know it (except maybe by browsing through some of the previous questions in this newsgroup before posting yours – always a recommended practice) , but this is a classic ADO newsgroup. ADO.Net bears very little resemblance to classic ADO so, while you may be lucky enough to find a dotnet-knowledgeable person here who can answer your question, you can eliminate the luck factor by posting your question to a group where those dotnet-knowledgeable people hang out. I suggest microsoft.public.dotnet.framework.adonet.

You see a developer has given me a text file that creates some stored procedures for a database. I am in the process of creating a app that will create the database along with the stored procedures.

I don't want to rewrite what the developer wrote I just want to be able to read the file content and run it to create the stored procedures. Will using SQLDMO help?

Just read the text into a variable, parse it to remove all GO statements, and run it via a SqlCommand object ...
