Hi to all,

I'm experiencing a weird problem with Simply Accounting 9.0 running on a Windows 2000 workstation.

Things were just fine under windows 98 but when I reinstalled a new machine the "link" to preformatted reports of simply accounting stop working.

Here is the initial setup :

2 clients (Win98) and 1 server (Windows XP)

The 2 clients have limited access to simply accounting databases on a remote windows XP machine hosting all the necessary files of simply accounting.

The 2 clients could print their invoices using a preformatted page setup (also known as "Crystal Reports" templates) wich resides on the server machine.

I reinstalled clean one of the workstation with windows 2000. Since then whenever I choose "custom" template in the configuration menu of Simply Accounting, and try to print say and invoice, I get an ODBC error with an expected argument that apparently is missing... The printing thus fails.

ACCPAC support desk was all along useless. I don't understand how come they have no documents on this problem... We waisted a lot of time with them and nothing is fixed. Now it seems that a ODBC link is missing somewhere but how to fix this ???
