Hi,

I'm an amateur programmer and I have been using Delphi but want to start using C#.

I need to connect to some existing Paradox database tables but I'm not having any luck with it using VS 2005 Beta 2. I've searched with google and on MSDN but still can't get it working.

I set up the connection using the wizards and in Server Explorer I can see the table fields. If I do a SQL Query, I can see the data. The problem is when I go to create a Data Source so I can use the data in a grid it doesn't work, I get the following error with every table:

```
<'C:\DBTEST'..'MODULE'>
```

Error in SELECT clause: expression near "".

Missing FROM clause.

Unable to parse query test.

I can't find where I would be able to modify these sql queries to try and fix it. I've spent hours reading up on connecting with OLEDB or ODBC but haven't been able to get it working. Any suggestions? Thanks.

Regards-Michael G.
