Moral: always include the error message you are getting.

I used the SQL Profiler to see what Enterprise Manager is up to. It turns out that it generates this command:

```
exec sp_executesql N'UPDATE "JUNI.bos_sommar"."dbo"."currencies" SET "curpriceib"=@P1 WHERE "curcode"=@P2 AND "curname"=@P3 AND ...
```

Note how the first pair of " are placed. That does not mean the linked server JUNI and the database bos_sommar. That means the database "JUNI.bos_sommar".

Thus, a pure and plain bug.
