I'm afraid that I'm running out of ideas. Well, one last straw: could there be triggers on the table producing result sets?

But in my experience, it's always a good idea to get all result sets, one or another. In the naked OLE DB API, I prefer to use `IMultipleResults` and the `iterate over IMultipleResults->GetResult` until it returns `DB_S_NORESULT`. In an interface like ADO you would iterate over `..NextRecordset` or just simply `adExecuteNoRecords` to discard everything.

Exactly how you do this in the consumer templates, I don't know, but you might be able to make that out.
