Thanks – that answers one of my questions of what versions of mssql support that. I only found any info in 2005 books on line so I didnt think it was supported on 2000. I'll have a look.

The other thing I'm missing is currently in ICommand.execute I pass IDBAsyncStatus or IMultipleResults. Can these still be used when you need to endup with ISequentialStream? Initial tests say no but it was a quick test and I havent finished all the possible combinations.

Using Oledb Interfaces directly (not ado or .net drivers), how do I get the xml result of a select statement that uses For XML AUTO.

At <http://go.microsoft.com/fwlink/?LinkID=4172> there is a set of samples for OLE DB and ODBC programming. I believe there is a sample for retrieving XML data.
