Alberto Demichelis ([AlbertoDemichelis@xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx](mailto:AlbertoDemichelis@xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)) writes:

My questions are:  
Is it possible to perform sn asynchronous query? (I guess so I read about it but found no sample)

Yes. This is a starting point:  
<http://msdn2.microsoft.com/en-us/library/ms724368.aspx>

I have not worked with it myself, nor do I know of any samples.

Is it possible to be sure that resulting the recordset of a select is already filled? (in the context of an asynchronous query)

Not sure what you mean, but it appears that the way the consumer that there is data to retrieve is by polling. As I understood it, you may find a rowset that is not yet complete.

Alternatives to OLEDB?

ODBC is probably an interface that is easier to work with from a language like C++, and ODBC also has asynchronous support. I have not used ODBC that much myself, though.
