Hi,

I have implemented get/set methods for DataSource/Info/Init properties. When I try to use Data Link Properties I face some problems--

1. All options on 'Connection' and 'Advanced' Tabs are disabled. What default properties are required and what settings do I need to expose in order to enable options on these tabs?
2. The 'All' Tab displays the init properties which are required by the provider. But when I try edit these options the new value is not entered and old(default) is also lost. Also the "password" displays the text and '*'. There are 'flags'displayed before all the required properties. What is wrong?
3. If I click OK without modifying anything(opting for defaults), the information for all the required properties is not entered in the .udl file. The contents are just following -

```
=====
[oledb]
; Everything after this line is an OLE DB initstring
Provider=MYOLEDB;Persist Security Info=False
=====
```

What is required to let all the information go in the .udl?

Thanks,
Vivek.
