Hi,

I have miniport driver which is using NdisMIndicateStatus function to send some "events" (my own status values) via transport driver into application. Everything works as long as I don't bridge my connection with any other network interface using standard Win XP bridge. When my interface is bridged then transport driver is no longer receiving status indications from my miniport driver. Are they filtered by the bridge driver? Is there a solution to that or I have to change the whole mechanism of sending events up from miniport driver?

Thanks for help

Marcin
