if you just want this to work in explorer, you can write a shell namespace extension, no FS filter. if you want this to work on the command line, a driver which exposes itself as a disk (no need for an FS filter) should work.

Hello,

I don't know whether this is possible, but if you want to make a file system driver you should get Rajeev Nagars book "Windows NT File System Internals: A Developer's Guide"

In article <unhL6hCPFHA.904@xxxxxxxxxxxxxxxxxxxxxxxx>, umut_ozden@xxxxxxx says...

Hi,

I would like to write a program:

In Windows Explorer, after drag&drop a file to a pre-defined drive letter (for example F:) the file should be sent through the COM port to an external device(digital satellite receiver).

Where should I start?

Do I have to write a device driver?(So, is it right place to ask the question?)

I'm using Borland C++ Builder 5.

Do I have to use VC++ or can non-Microsoft compilers do the job?

Re: Assigning a drive letter to com port

Thanks...
