If you use signability to sign the driver make sure that the OS is set correctly. For example:
/os:264 – means Windows XP, 32-bit version and Windows Vista, 32-bit version

Take a look at this:

<http://msdn2.microsoft.com/en-us/library/aa906345.aspx>

Have fun

Mathias Ellinger wrote:

Hallo,

For VISTA I have build a signed driver package with a "VeriSign Class 3 Code Signing 2000 CA"

ID. Our Rule is using the same package for Windows XP.

In Vista the installation is OK but in Windows XP I can see some errors in setupapi.log

#E360 An unsigned or incorrectly signed file "c:\windows\inf\oem9.inf" for driver "XXX" will be installed (Policy=Ignore). Error 1168:

What is not correct with my signing ? The result: class installer entrys (ICON, name) are not installed in registry and CoInstaller DLL is not running by the installation.

When I break this signed package (insert a space into INF file) all is fine.
