Hi,

I've been assigned at task to develop a driver for a HW company. The Company has developed a Microphone that sends data from and extern microphone to the PC. The data recorded is saved in user memory. My task is to develop a "lite" microphone driver that takes that sound data and send it to what ever application that is using my microphone driver i.e. if Messenger is using my driver the user can talk in the HW and use it as an microphone. A simple task i guess :). However I'm quite stuck. I have read a lot of documentation but I don't quite see how to start. Should I develop a driver that only implement the IRP\_MJ\_WRITE or can it be done by developing a User Mode driver. Any help or good ideas would greatly be appreciated.
