I tried signing my driver binary as per the procedure in kmcs_walkthrough.doc
It works fine. But I don't understand a few things.

```
Signtool sign /v /ac MSCV-VSClass3.cer /s my /n contoso.com /t  
http://timestamp.verisign.com/scripts/timestamp.dll mydriver.sys
```

In the above command they have used /ac option where the cross certificate
MSCV_VSClass3.cer is used. Can we sign the binary using the pfx file itself???

What is the difference between the two (pfx and cross certificate signed)?
